Part 1:

What is defined in the controllers?

`coordinates.server.controller:`

- config
- request

`listings.server.controller:`

- mongoose
- Listing
- functions used: list, read, create, update, delete, listingByID

How the router makes use of the controllers to determine the flow of request handling?

- first it includes the 2 controller files
- includes express
- if it has '/' then call functions from the `listings.server.controller` file
- if it has('/:listingID') then call functions from the same file
- again, if a parameter is specified, a function from the same file is called
- `coordinates.server.controller` is used to receive the coordinates

How middleware is used throughout the application to modularize the code?

- middleware is used to call a function/check errors before passing a request
